It came to our attention, that by mistake, we had plotted values of inverse tortuosity instead of tortuosity in Figure 2D of our article. Correct values of tortuosity are shown in the new version of Figure 2 shown below.

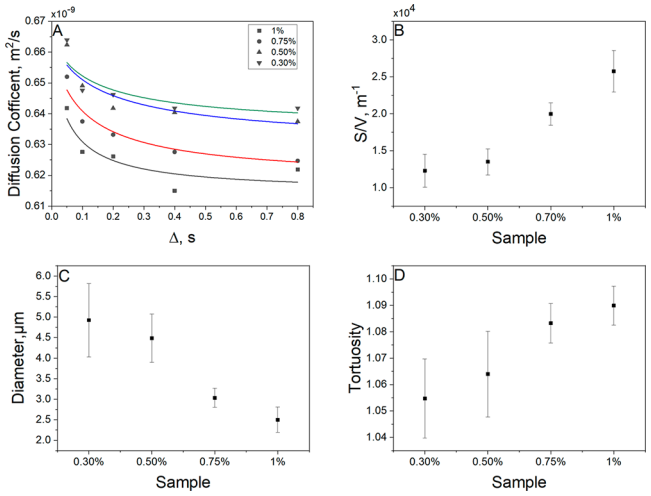

**Figure 2.** (A) Apparent diffusion coefficients of cyclohexane adsorbed in CNF aerogels as a function of diffusion times. The solid lines show the fits of eq 4 to the data. (B) Surface-to-volume ratios derived from the initial slope of the $D$ vs $\Delta$ curves. (C) Pore diameters calculated from the $S/V$ values assuming a cylindrical pore geometry. (D) Tortuosities of the pore networks resulting from the fits.

Related to the discussion about tortuosity, a correct version of the following sentences on the page 30992:

"The tortuosity of the CNF aerogels was high (see Figure 2D) due to open and interconnected structure of the porous networks. The tortuosity decreased from 0.95 to 0.92 when the consistency of the samples increased from 0.3% to 1%."

is

"The tortuosity of the CNF aerogels was low (see Figure 2D) due to open and interconnected structure of the porous networks. The tortuosity increased from 1.05 to 1.09 when the consistency of the samples increased from 0.3% to 1%."

Furthermore, a correct version of the sentence on the page 30994:

"The observed tortuosity was very high due to the open structure of the pore network, and it decreased from 0.95 to 0.92 with increasing consistency."

is

"The observed tortuosity was low due to the open structure of the pore network, and it increased from 1.05 to 1.09 with increasing consistency."
